**RE: Romet RMT Meter Launch**

At Romet, we take pride in developing new and improved products for the natural gas industry. As noted earlier this year, Romet will be launching several new products in 2017.

Phase one of the launch includes the full production release of Romet's RMT (Rotary Meter Technology) in imperial sizes from 600 cfh to 5m. The advancement in our product has been over three years in development and leverages our over 40 years of experience in the design and manufacture of precision rotary meters and ancillary equipment for the natural gas industry. The product is fully compliant and tested to ANSI B109.3.

Phase two of this project which is scheduled to be released in the fall of this year will extend the RMT size ranges from 7m – 23m.

Romet will supply this meter design on all your future orders unless specified, otherwise at our discretion.

We think you will find many benefits in promoting and selling this product. A few features of the meter include:

- Lower start rates
- Greater rangeability
- Pinned metal gears
- Mechanical backup counter (standard)
- Mechanical TC now available in sizes 600, 1000, and 1500 cfh, and
- Bossed o-ring plugs

Attached are electronic versions of our data sheets, which you will also be able to access from our web site. Printed copies for your promotional efforts will be mailed to your office during the next week.

For additional information, please contact Romet or your regional sales representative to learn more about the product or stop by our booth (#1135) at the AGA.
