Kemp Meek Manufacturing, Inc. manufactures a complete line of multi-lingual readers that are designed to best fit your meter reading requirements. With larger character visual displays, the same readers that are used with a handheld computer route systems may also be used as stand alone reader/testers. With the memory option, almost 1,000 reads

can be collected and processed in a stand alone mode.

Both the 70101a and 70101b are designed to attach to most all the industry standard handheld computers and are supported by most all meter reading software systems.

Meter type identification is fully automatic, requiring no switch setting by either the operator or the route software. The reader stays on the last meter type read, so most searching is eliminated. When a search is required, all meter types present are checked. A major benefit to the user is that just the meter types in your system are present which greatly reduces search time. If you add new meter types they can be activated in the field without returning the device to the factory.
